TWIN ENGINE SYNCHRONIZER LIMIT SWITCH ADJUSTMENT

The Limit Switches are set to automatically turn off the Synchronizer if the Slave engine can not meet the rpm demands of the Lead engine.

**NOTE:** Control Cable to bridge should be disconnected when adjusting limit switches.

With the engine throttle lever against the idle stop, move collar so that it is between 1/16" - 1/8" away from the button on the microswitch. Secure collar with 1/8" allen wrench.

**NOTE:** LIMIT SWITCH FUNCTIONS WILL BE REVERSED WHEN USING PUSH-TO-OPEN FORMAT.
